Important Disclaimer

This guide is for educational and practical purposes only. AI systems can produce inaccurate, incomplete, or outdated information, and outputs should always be reviewed before you rely on them. Leke Tech and the author are not responsible for decisions, losses, or outcomes resulting from the use of AI tools, prompts, or frameworks described here. You remain fully responsible for verifying results and applying your own judgment before acting on any AI-generated output, especially where money, legal matters, health, or another person's rights are involved.

About Leke Tech

Leke Tech is a creative-tech company helping businesses use design, technology, and digital strategy to grow. AILEx is our flagship initiative for turning AI from a buzzword into a practical, everyday advantage for founders, professionals, freelancers, and students alike.

About AILEx

AILEx - The AI Leverage Experience by Leke Tech is an initiative focused on practical AI application. Its purpose is simple: *Help people move from knowing about AI to knowing what to actually do with it.* AILEx brings together practical demonstrations, frameworks, conversations, and hands-on applications across business, career, productivity, creativity, and automation.

The philosophy is simple: *AI is the tool. Your thinking is the advantage.*

About The Author

Brice Leke is a software engineer, digital strategist, and entrepreneur, **Founder & CEO of Leke Tech**, a creative-tech company focused on helping businesses build stronger brands and leverage technology for growth.

With experience across software development, branding, digital marketing, and business technology, Brice works at the intersection of technology, creativity, and business growth. Through Leke Tech, he helps businesses use digital tools not simply to improve their online presence, but to build systems that support visibility, customer acquisition, and growth.

He is also the founder of AILEx (The AI Leverage Experience). His approach to AI is grounded in practical adoption: helping people identify where AI can create meaningful leverage in their everyday work, rather than treating AI as a purely technical or theoretical subject.

Before You Begin

A Note on Accuracy

AI systems can produce inaccurate, incomplete, or outdated information. The frameworks in this guide are built to reduce that risk, but they cannot eliminate it. Always verify important outputs, especially anything involving money, legal matters, health, or another person's rights and apply your own professional judgment before you act.

How to Use This Guide

You don't need to read this guide thinking about every possible use of AI. You need one real problem and a willingness to try.

- Read one section.
- Pick one real problem from your own work, business, or studies.
- Apply the framework to it.
- Review what AI gives you.
- Improve it, then repeat.

This guide is organized around four questions. Whichever one matches what you're facing right now is the chapter to start with.

What's happening right now	Start here
If you're stuck on a decision or a messy problem	→ THINK
If you need to produce something	→ CREATE
If you have too much information and not enough clarity	→ UNDERSTAND
If you keep doing the same task over and over	→ SYSTEMIZE

Don't start with the tool. Start with the problem.

Who This is For

You could be: *a business owner, a freelancer, a professional, a student, a creator, an educator, a researcher, a developer, someone simply trying to work more efficiently*

You do not need to be an AI engineer. You do need to know what you are trying to accomplish. That is where this guide begins.

PART I: THE SHIFT

1. AI Is Not the Advantage. Leverage Is.

Artificial intelligence is moving fast, but for most people, practical use hasn't kept up. Most people are stuck using powerful AI models the way they'd use a search engine, or as a novelty for the occasional question.

At Leke Tech, we work at the intersection of creativity, technology, and business growth. AILEx exists to close that gap. To turn AI from a buzzword into something you actually use, every week, in your real work.

"AI isn't valuable simply because it can generate answers. Its real value comes from how intelligently you integrate it into your thinking and work."

- Brice Leke

That's the central idea behind everything in this guide:

THE CORE THESIS

AI leverage = better thinking + faster creation + deeper understanding + repeatable systems.

AI as a Collaborator, Not an Oracle

Most people ask AI for the answer. The stronger move is to make AI think with you. To use it as a partner that helps you see a problem more clearly before you decide anything.

What AI Cannot Do For You

- ❖ It cannot take responsibility for a decision. You remain accountable for anything built, published, or acted on.
- ❖ It can sound completely confident while being wrong. This is called **hallucination**, and it's a real, ongoing limitation.
- ❖ It doesn't know your organization's privacy obligations. Sensitive data needs a human decision before it goes into any AI tool.
- ❖ It won't flag when it's making an assumption unless you explicitly ask it to.

KNOW WHEN NOT TO TRUST AI

Be especially careful when: the answer depends on current facts; the cost of being wrong is high; information is missing; the model can't show its evidence; the output affects someone else's rights, money, or safety; confidential information is involved. AI confidence is not evidence of correctness.

Before You Paste Any Data

Privacy isn't just a question of public vs. private tools. Before pasting information into any AI system, check:

AILEx - The AI Leverage Guide

- What exactly is this data, and who does it belong to?
- Does this tool retain what I paste, and for how long?
- Does my organization have a policy that covers this?
- Am I using a personal or workspace account, and does that change the answer?
- Are there names, credentials, financial details, or health information in this text?

AI does not replace your responsibility for decisions or published outputs. That responsibility stays with you, always.

2. The AILEx Framework

Everything in this guide sits inside four pillars. They're not four separate skills to master in order, they're four lenses you switch between, depending on what your week actually looks like.

Pillar	Founder/Business Example	Professional Example	Student Example
THINK	Diagnose declining sales	Decide between two career paths	Choose a study strategy before an exam
CREATE	Turn one offer into a marketing campaign	Turn one idea into a client-ready presentation	Turn one topic into a full set of study materials
UNDERSTAND	Make sense of a spreadsheet of customer feedback	Digest a long research report before a meeting	Extract the key ideas from a 200-page textbook
SYSTEMIZE	Automate lead follow-up	Build a repeatable weekly reporting process	Build a repeatable revision workflow

Hold onto this table. It's the map for the rest of the guide, and you'll come back to it in Part VI when you're deciding which pillar fits a new problem.

PART II: THINK

3. Don't Ask AI for Answers Yet

Most people fail with AI at the very first step: they type "write me a marketing plan" and get back a generic list of textbook tips. That's not AI's fault, it's what happens when you ask for an answer before the model understands your actual situation.

"The goal is not to ask AI for an answer directly. The goal is to structure your own thoughts. AI works on the principle of garbage in, garbage out, the better the context you provide, the better the output you receive in return."

- Brice Leke

During the AILEx26 live demonstration, we used the real example of a roasted chicken restaurant owner in Yaoundé who was getting customer interest but couldn't convert it into recurring sales. By forcing the model to diagnose before recommending, the output went from generic theory to something the owner could actually act on.

4. The THINK Framework

THE UNIVERSAL THINK FRAMEWORK

Context → Problem → Questions → Evidence → Options → Recommendation → Test → Action

❖ CONTEXT

Tell AI what it needs to know. Include relevant information such as: *what you do, who you serve, where you operate, what you have already tried, available resources, constraints and goals*. Context gives the model a frame.

❖ PROBLEM

State the actual problem. Not: *"I need marketing"* Instead: *"People are showing interest in my service, but very few are becoming paying customers."* That is a problem AI can investigate.

❖ QUESTIONS

Don't immediately ask for a solution. Ask: *"What do you need to know before diagnosing this problem?"*. This is one of the most useful habits in this entire guide. Let AI identify information you may have overlooked.

❖ EVIDENCE

Give AI the information it needs to reason from. This could include: *customer feedback, sales numbers, survey responses, research, previous attempts, financial data, documents, screenshots, notes*. Separate what you **know** from what you **assume**.

❖ OPTIONS

Once the problem is understood, ask AI to generate possible approaches. Do not ask for one answer immediately. *Ask for alternatives then compare them.*

❖ RECOMMENDATION

Now ask: *“Based on the evidence, which option should I investigate first, and why?”*

The recommendation should come after the diagnosis. Not before it.

❖ TEST

Before investing heavily, ask: *“What is the cheapest realistic way to test whether this recommendation is correct?”* This changes the conversation from speculation to experimentation.

❖ ACTION

Finally: *“What should I do next?”* Turn the reasoning into a concrete action plan.

This is **prompt architecture**. You are not memorizing prompts; you are learning how to build them.

Step 1: The Diagnostic Prompt

This prompt is deliberately built to stop the model from jumping to conclusions. It forces it to ask you questions first, uncovering blind spots you may not have named yourself.

Role

Act as a business management consultant and diagnostic strategist.

Context

I run a small, growing business. - Industry/Product: **[INSERT PRODUCT/SERVICE]** - Target Market/Location: **[INSERT LOCATION & AUDIENCE]** - Current Situation: **[WHAT'S HAPPENING NOW]** - Constraints: **[YOUR REAL LIMITS – TIME, MONEY, TEAM]**

Task

Help me critically think through this situation. Do NOT provide recommendations or solutions yet.

Instructions

1. Identify the most critical diagnostic questions needed to uncover the root problem. 2. Categorize them (e.g., Customer, Offer, Pricing, Marketing, Sales, Competition, Operations). 3. For each question, briefly explain why the answer matters. 4. Do not assume or invent any facts I haven't provided.

Step 2: Feeding the Data

Answer the model's questions honestly and in detail. Then feed those answers back in with a second prompt asking for a rigorous, evidence-based analysis, a primary bottleneck, the evidence behind it, the assumptions being made where data is thin, two or three realistic strategic options, the risk in each, a priority recommendation, and a concrete first-week action plan.

Step 3: Challenging the Recommendation

Never accept an AI model's first recommendation at face value. Before spending money or time on it, stress-test it: What could make this fail? What missing information would change the conclusion? What's the lowest-cost way to test this in 48 hours? What's a safer, lower-downside version of the same plan?

Step 4: Refine, verify and use

- Give the model your feedback and ask it to improve the output.
- Check important facts independently. Only then move the output into your real work.

KEY TAKEAWAY

Make AI diagnose the problem before it recommends a solution. This reduces, though never fully eliminates the risk of generic, hallucinated advice.

5. Practice: Diagnose a Real Problem

Before you move to the next pillar, apply THINK once, to something real:

1. Name one decision or problem you're currently avoiding or unsure about.
2. Run the Diagnostic Prompt above, filling in your real context.
3. Answer the model's questions honestly, don't rush this step.
4. Run Step 2, then stress-test the result with Step 3.
5. Write down one thing this process surfaced that you hadn't considered before.

PART III: CREATE

6. Stop Creating From Scratch

Most people treat every piece of content as a new project. A new social post, a new email, a new presentation, research paper, video, report, each one built from nothing. That's the slow way. The leverage move is: one strong input, many outputs.

"When you review AI-generated content, review it with an editorial eye. Identify anything that sounds generic, repetitive, poor quality or obviously AI-generated, and rearrange those parts to sound natural, specific, and human."

- Brice Leke

7. The CREATE Framework

THE UNIVERSAL CREATE FRAMEWORK

Source → Objective → Structure → Generate → Adapt → Review → Repurpose

❖ SOURCE

Start with something. Your source could be: *an idea, a document, notes, research, a transcript, a webpage, customer feedback, an existing piece of content.*

❖ OBJECTIVE

What are you trying to create? For example: *"Turn this research into a presentation for university students."*

❖ STRUCTURE

Tell AI what the output should contain. For example: *"Create a 10-slide presentation. Each slide should contain one main idea, a short explanation, and a practical example."* Include as much detail as you can.

❖ GENERATE

Create the first version.

❖ ADAPT

Turn the same material into different formats. For example: *LinkedIn post, WhatsApp message, video script, email, presentation, infographic*

❖ REVIEW

Check the output. Does it: *sound like you want? preserve the original meaning? contain unsupported claims? repeat itself? fit the audience? achieve the intended purpose?*

❖ REPURPOSE

Extract more value from the same source. The goal is not to generate more content for the sake of generating more content. The goal is to *get more useful outputs from work you have already done.*

Template: Multi-Channel Content Repurposing

Source Idea

[insert your core idea, reference or message]

Target Audience

[Who this is for]

Task

1. Generate 5 distinct angles on this idea that provoke curiosity rather than simply explaining it. 2. Turn the strongest angle into 5 platform formats: a LinkedIn post, a WhatsApp/community message, a short-form video script, a newsletter/email, and a one-line flyer headline.

Purpose

[What should this accomplish?]

Format

[What should it look like?]

Tone

[How should it sound?]

Constraints

- Keep the core premise consistent across all formats. - Adapt vocabulary and structure to each channel. - Avoid generic phrasing like "in today's fast-paced world" or "game changer."

One Input, Three Outcomes

Pillar	The Leverage Move
THINK	One customer-acquisition problem → a diagnosed bottleneck and a 7-day plan
CREATE	One offer → a LinkedIn post, a client presentation, a content plan, study guide, a short video
UNDERSTAND	One spreadsheet of feedback → three clear patterns and one decision

KEY TAKEAWAY

Scale your ideas, not your workload. One strong input branches into multiple outputs, each adapted for its channel, while the core message stays unified.

8. Practice: One Idea, Five Outputs

1. Pick one real idea, offer, announcement, or lesson you need to communicate this week.
2. Run the Repurposing prompt above.
3. Read every output with an editorial eye, cut anything that sounds generic or robotic.
4. Publish or send at least one of the five outputs.

PART IV: UNDERSTAND

9. AI as an Information Interpreter

"AI can summarize documents" undersells what's actually possible. There's a real difference between four things, and knowing which one you need changes what you ask for:

Level	The Question It Answers
Summarization	What does this document literally say?
Analysis	What patterns show up across it?
Interpretation	What might those patterns mean?
Decision support	What should I investigate or do next?

10. The UNDERSTAND Framework

THE UNIVERSAL UNDERSTAND FRAMEWORK

Source → Question → Structure → Analysis → Verification → Insight → Action

❖ SOURCE

Give AI the material.

❖ QUESTION

Tell it what you want to understand. Don't just say: *"Summarize this."* Ask: *"What are the three most important ideas I need to understand before making a decision?"*

❖ STRUCTURE

Tell AI how to organize the information. For example: *key facts, recurring themes, disagreements, evidence, unknowns, implications*

❖ ANALYSIS

Ask AI to identify: *patterns, relationships, contradictions, repeated problems, unusual observations, information gaps*

❖ VERIFICATION

Check whether the conclusions are actually supported by the source.

❖ INSIGHT

Ask: *"What does this information suggest?"*

But distinguish between what the source **says** and what AI **infers**.

❖ ACTION

Finally: *"Based on these findings, what should I investigate or do next?"*

The Universal Data Analysis Prompt

Input Data

[Paste your raw text, transcript, survey notes, or report]

Task

Perform an objective, data-driven analysis of this input.

Required Analysis

1. Facts: What does the data explicitly say, no interpretation yet. **2. Patterns:** What recurring themes, behaviors, or trends appear? **3. Interpretations:** What might those patterns mean? Label these clearly as interpretation, not fact. **4. Questions:** What's missing that would change the analysis? **5. Actions:** What 2-3 things should I investigate, test, or do next?

Constraints

Base your findings only on direct evidence in the input. Do not invent, extrapolate, or assume market data that isn't there.

Where This Applies

- A founder feeding in a week of customer messages to find the real complaint behind the noise.
- A professional digesting a 40-page report before a meeting, and needing the three things that actually matter.
- A student pasting in lecture notes or a dense chapter and asking for the patterns and gaps, not just a summary.

11. Practice: Turn Messy Information Into a Decision

1. Find one real, messy source, a document, spreadsheet, chat log, or set of notes.
2. Run the Data Analysis prompt above.
3. Check the "Interpretations" section against your own judgment do you agree?
4. Pick one action from the output and actually do it.

PART V: SYSTEMIZE

12. Stop Solving the Same Problem Twice

This is the pillar most people skip, and it's the one with the highest long-term payoff. If you're re-explaining the same context to AI every single time, or repeating a task manually every week, you're leaving leverage on the table.

13. From Task to Workflow

Systemization isn't a single leap from "manual" to "fully automated." It moves through four levels:

Level	What It Looks Like
1. Manual	You perform the task yourself, every time, from scratch.
2. AI-Assisted	AI helps you do it faster, but you still start and finish each cycle.
3. Automated	A trigger causes the workflow to run without you starting it manually.
4. Agentic	A system plans and executes multiple steps, using tools, inside boundaries you define.

Most people try to jump straight to Level 4. Don't. Move one level at a time, each level should feel obviously better than the one before it before you go further.

14. Build Your First AI Workflow

THE WORKFLOW ARCHITECTURE

Trigger → Input → AI Processing → Decision → Human Review → Action → Record

Worked Example: Customer Inquiry Handling

Step	What Happens
Trigger	A customer message arrives
Input	AI reads and understands the message
Processing	AI classifies the type of inquiry
Decision	AI drafts a response based on the classification
Human Review	You approve, edit, or reject the draft
Action	The response is sent, the lead is recorded

Notice where the human stays in the loop, the Review step never disappears, even at Level 4. That's a deliberate design choice, not a limitation. AI does not replace your responsibility for what gets published or sent.

The Systemization Test

A task is a good candidate for systemization when it is:

- Repetitive, predictable, time-consuming, based on information you already have, governed by clear rules and easy to review

Be more cautious when the task involves:

- sensitive decisions, high consequences, ambiguous judgment, confidential information and actions that cannot easily be reversed

Worksheet: Map Your First Three AI Roles

For each role below, fill in the scope, the tone, and one task you could hand it today.

- Agent 1: Executive Assistant. Scope: _____. Tone: _____. First task: _____.
- Agent 2: Creative Director. Scope: _____. Brand rules: _____. First task: _____.
- Agent 3: Support/Ops Specialist. Scope: _____. Guardrails: _____. First task: _____.

Context Window Discipline

A common mistake is running one continuous chat thread for everything; grocery lists, CV writing, business strategy, all mixed together. This corrupts the model's context and produces generic, sometimes contradictory output.

Go inside projects. Create a new project for your business. Within that project, create separate chats, and each one serves a distinct purpose. One as your executive assistant, another as your creative director, another as your customer support representative.

15. Practice: Systemize One Repetitive Task

1. Name one task you repeat every week, the more mechanical, the better.
2. Map it against the Workflow Architecture: what's the trigger, the input, the decision, the review point?
3. Start at Level 2 (AI-assisted) even if you eventually want Level 3 or 4, don't skip the step where you build trust in the output.
4. Only automate the trigger (Level 3) once you're confident in the AI-assisted version.

PART VI: THE AI LEVERAGE PLAYBOOK

16. Which Pillar Do I Need?

Return to this whenever you're not sure where to start:

What's Happening	Pillar
Stuck on a decision or messy problem	THINK
Need to produce something	CREATE
Too much information, not enough clarity	UNDERSTAND
Keep repeating the same task	SYSTEMIZE

17. The Anatomy of a High-Leverage Prompt

A prompt is not magic wording. It is an instruction.

A useful prompt answers: *What do you know?* *What do you want?* *What should AI do?* *What should it not do?* *What should the output look like?*

Every strong prompt in this guide follows the same underlying architecture. Once you see it, you can build your own instead of relying on templates.

Element	What It Does
Role	Establishes the perspective AI should think from
Context	What does AI need to know about your situation?
Task	What are you actually trying to accomplish?
Constraints	What must it avoid; assumptions, tone, scope?
Process	How should it approach the task, step by step?
Output	What should the final result look like?
Review	How should the result be checked before you trust it?

Annotated Example: Why the THINK Diagnostic Prompt Works

- **Role** ("business consultant and diagnostic strategist") → sets a diagnostic, not a generative, mindset.
- **Context** (industry, market, situation, constraints) → gives the model your real situation instead of a generic one.
- **Task** ("help me think, don't recommend yet") → prevents premature, generic answers.

- **Instructions** (categorize questions, explain why each matter, don't fabricate) → controls both structure and honesty.

Once you can name these parts in a prompt that works, you can build a new one from scratch for a problem this guide never covered.

18. The AI Review Loop

THE REVIEW LOOP

Generate → Review → Challenge → Refine → Verify → Use

Reviewing AI output isn't the same as iterating on it. Here's what real iteration looks like:

Prompt 1

AI gives a mediocre, generic first output.

Human Review

"This is too generic, it could apply to any business."

Prompt 2

Add specific audience, real examples, and explicit constraints.

Human Review

"Better, but the recommendation isn't realistic given my budget."

Prompt 3

Challenge the assumption directly; ask AI to account for the real constraint.

Final Output

Something you can actually use because you iterated, not because you accepted the first draft.

This before → after → why sequence is the single most valuable habit in this guide. A finished prompt teaches you what to paste. This loop teaches you how to think.

PART VII: IMPLEMENT

19. Your First AI Leverage System

Fill this out for one real area of your work, business, or studies:

- The problem or task: _____
- Which pillar it belongs to (THINK / CREATE / UNDERSTAND / SYSTEMIZE): _____
- The prompt or workflow I'll use: _____
- How I'll review the output before trusting it: _____
- What I'll do differently next week because of this: _____

20. Choose the Tool for the Job

Tool capabilities change fast, what's true today may not be true in six months. Choose by job, not by hype, and check current documentation before relying on a specific feature or pricing tier.

Job	What to Look For	Tool
Think	Strong reasoning and back-and-forth conversation	Chatgpt, Claude, Gemini, Grok, Kimi, Z.ai, qwen, deepseek...
Create	Writing, design, image or media generation	Google flow, Higgsfield, Canva, Speechify, Magnifik, NotebookLM...
Understand	Large context windows, source-grounded analysis	NotebookLM, Gemini, Chatgpt, Claude...
Systemize	Integrations, automation, API access	Zapier, Make.com...
Research	Current information with citations	Perplexity, Gemini...
Build	Coding and app development	Cursor, Antigravity, Bolt, Lovable, Claude code, Github copilot, Kimi code, Z.ai, codex

A NOTE ON TOOLS

All tools named in this guide are not permanent recommendations, because tool capabilities change quickly. Search for current, well-reviewed options in each category before committing to one.

21. Your 30-Day AI Leverage Plan

Don't try to apply all four pillars at once. Spread them out:

Week	Focus
Week 1	THINK: diagnose one real problem instead of guessing at a solution.

Week	Focus
Week 2	CREATE: turn one input into multiple outputs you actually publish or send.
Week 3	UNDERSTAND: feed AI one messy, real source and act on one finding.
Week 4	SYSTEMIZE: map and build the first level of one repeatable workflow.

By the end of 30 days, you won't have "learned about AI." You'll have three or four things in your actual work that are already running differently.

CLOSING NOTE

This guide gave you a practical four-part framework for applying AI to real work: Think, Create, Understand, and Systemize. Reading it will not change your business, your career, or your studies. Building your own prompts and workflows, and testing them against real problems, will.

"Don't just use AI. Leverage it."

- **Brice Leke**

Ready to Go Further?

If you're a founder, business leader, or professional looking to build tailored, automated workflows for your specific business realities, our advanced implementation program covers;

- ❖ **Custom Workflow Architecture:** dedicated AI pipelines built around your operations
- ❖ **Team Training & SOPs:** helping your team move from generic output to real execution
- ❖ **Automated System Integration:** connecting customer service, marketing, and reporting directly to AI
